Php formatter sublime text

This is a sublime Text 2 plugin that allows you to format your PHP code. It uses php beautifier. Installation Install php-pear and php-cli with your package manager: php-pear & php5-cli with Debian php-pear & php with Archlinux Install php beautifier from pear channel: sudo pear install - alldeps channel://pear.php.net/php_beautifier-0.1.15 Clone or download files and copy them to your Packages folder. You can access it using Preferences-> Browse packets in sublime text. Usage ctrl + shift + P and type Format: PHP, or you can use ctrl + alt + f keybinding. Customizing a script section can define some php_beautifier.py. The default options are: PHP_OPTIONS = -s4 -l 'ArrayNested()' (indent with 4 spaces and nested arrays). Learn more Envato Authors ThemeForest So I've been using Sublime Text 3 in recent months and I love it! The only issue is that I can't find any nice autoformat plugin/package that works with PHP. I found it in HTML, CSS etc (HTML-CSS-JS Prettify) and it works great, but no php. Some that I found don't really do the job very (I do it better manually) and not by WordPress standards in the way they do the job (for example, they put the register_sidebar code all in one line). PHPTidy is what I'm hearing about all the time, but it doesn't work with ST3, just ST2. ST3 users and everyone else how do you format your PHP wordpress? Doing it manually is what I hope you don't do, cause it is time consuming Jovana I format the code manually in sublime text 2 and I don't think it's time consuming Auto formatting code sometimes does not give you the results you want, so format it while you code 1 Like I use the same package control item but with ST2. ST3 was dumped when we watched it launch a car rewrite rundll.dll and a few others with a garbage code. Beta means As far as ST2 goes, there is no beta, OTS folders are well laid out so you can tweak Prettify a bit. Tip, don't worry. If you have a request, send it to the author of his packaging control page (best) or his website/Gist if you feel even Friendly. Tidy and Twig will do? The best practice, we thunk, was to run prettify as you like, get used to what you can tolerate, and CTRL-H or manually dig for your desired code profile. Profiles are a secret, eh. Archive your custom packages before quickly reinstall, and Prettify HTML just seems to behave better and better. My thought is, tomorrow prettify makes my coffee and ... -(:o) ~ ~ Closed. This issue is based on opinion. It does not currently accept the answers. Want to improve this issue? Update the question so that it can answer with facts and quotes when editing this post. Closed 5 years ago. I have been working in noble text for the last three months. I've found extensions for HTML Beautifier, JS and JSON beautifier. Now I want php beautifier extension. So, can anyone please suggest which extension I should use as a PHP beautifier? If the extension also checks for PHP errors, then that's good for me. Production February 9, 2017, 12:09 pm #1 Hey guys, I'm new to sublime text and so far I'm loving it. I have set it so I can auto format css, html and js. But for love or money I can't figure out how to do it in PHP. I use sublime text 3 on mac. Can someone help me with a noob guide on getting this right, I'm pulling my hair. 0 Likes Home Categories FAQ/Guidelines For Service Privacy Policy Sublime Text 3 is an awesome package of all sorts of all sorts of things, and in this blog post I write about packages that make me happy using web development. So let's start! Package Control First things first, we need to install Package Control to install other packages. To install package control, we open Command Palette to open it go to Tools->Commom palette or with shortcut Shift + Ctrl + P on Linux. Here is the picture: now we can install other packages with Package Control. You can search for and install other packages by name by opening the command palette and typing the Install Package, then you just type in the name of the package you want to install. Also, we can browse the and you can read the documentation, use and configuration of the packages. PHPFMT the first package I install after Package Control is phpfmt. These packages must be php developers. With PHPFMT you can format your code when you save the file to install the package using the package control press Shift + Ctrl + P to open the command pallette and type install, then type the package name, you can install in our case it is phpfmt. Before we can use this package, we need to determine the path to php binary file. Open configuration settings Preferences->Package Settings->phpfmt->Settings - User. Attention! Never modify Settin_gs - Default file because the changes will be lost when sublime updated. Specify php_bin location in php binary and do not forget to set format_on_save to and then you can forget about it all because it will format your php code automatically. SublimeLinter Sublime Sublime PHP (and need them needed SublimeLinter) rely on PHP built-in blower. This is a simpler version that works just for the blower, nothing else. This check errors your php code. Install it just as you installed phpfmt. GitGutter GitGutter shows you git diff on sublime. modified or deleted, updated? SideBarEnhancements SideBarEnhancements as the name suggests expanding the sublime's sidebar. SFTP Great package makes it very convenient to use SFTP, FTP and FTPS. It supports browsing, editing, and synchronizing remote folders between local and remote files. Also regularly upload, download, save or file open. jsPrettier This package is not php, but it is my go to package when working with javascript files. This package, for example, phpfmt formats javascript code. Before using this package we must install prettier depency install with this command npm install-g prettier Then install jsPrettier package and open the setting file like we opened phpfmt. As an example config: { debug: false, prettier_cli_path: /home/tasqyn/.asdf/installs/nodjs/9.2.0/.npm/bin/prettier, node_path: /home/tasqyn/.asdf/shims/node, auto_format_on_save: true, auto_format_on_save_excludes: [*/node_modules/*], allow_inline_formatting: true, custom_file_extensions: [], max_file_size_limit: -1, additional_cli_args: {}, prettier_options: { printWidth: 100, singleQuote: false, trailingComma: none, bracketSpacing: true, jsxBracketSameLine: false, parser: babylon, semi: true, requirePragma: false, proseWrap: true } prettier_cli_path - path to prettier. node_path - the path to the node You can change the settings according to your needs. Conclusion These are packages to use all the time. Of course, there are many packages of sublime Text 3, you can browse packagecontrol.io and choose your favorites. This is my first blog post as ever to make a lot of mistakes to feel free to point it out. Thanks for reading! You must be running a copy of PHP on the machine you are using the Sublime Text Plugin running with PHP 7.0 or a newer installed computer running plugin. Install this plug-in using Package Manager. In Sublime Text press ctrl +shift +P Select Package Control: Install Package Choose phpfmt Configuration (Windows) Edit configuration file (%AppData%\Sublime Text\Packages\phpfmt\phpfmt.sublime-settings) Field php_bin enter path to php.exe Example: php_bin. :c:/PHP/php.exe Configuration (OS X and Linux) Edit configuration file (phpfmt.sublime-settings) For field php_bin enter the path to php Example: php_bin:/usr/local/bin/php Settings Prefer using toggle options in the command palette. However, you might find yourself needing a setup, if PHP is running, use this option below in the configuration file. { php_bin:/usr/local/bin/php, } The following functions are available through the command palette (ctrl + shift + P or cmd + shift + P): phpfmt: format now phpfmt: indentation with spaces phpfmt: toggle additional conversions phpfmt: toggle toggle skip execution when .php.tools.ini is missing phpfmt: toggle autocomplete phpfmt: to depend Ffmt: toggle format save phpfmt: laiggle psr1 - Class and method names phpfmt: toggle psr1 phpfmt: toggle psr2 phpfmt: analyze this phpfmt: build autocomplete database phpfmt : getter and setter (camelCase) phpfm t: Getter and Setter (Go) phpfmt: getter and setter (snake_case) phpfmt: create PHPDoc block phpfmt: search .php.tools.ini phpfmt: reorganize content class phpfmt: enable/disable additional transformations phpfmt: remove information phpfmt: update PHP binary path Currently Supported transforms: AddMissingParentheses Add additional parentheses to new instantiations. The AliasToMaster Replace function replaces its masters— only the basic syntax alias. AlignConstVisibilityEquals vertically align the visibility and const block =. AlignDoubleArrow align T_DOUBLE_ARROW (=>). AlignDoubleSlashComments to align comments.////.//.//././/./align.//align.///align./ AlignEquals Align =. AlignGroupDoubleArrow aligns T_DOUBLE_ARROW (=>) by line groups. AlignPHPCode Align PHP code in the HTML block. AlignTypehint to align the suggestions for the function type vertically. AllmanStyleBraces Transform all curly braces into Allman style. AutoPreincrement Automatically convert post-vertebral to preincrement. AutoSemicolon Add semicolon reviews expire. CakePHPStyle Refers to CakePHP Coding Style ClassToSelf self is a preferred class, feature or interface. ClassToStatic static favors class, feature or interface. ConvertOpenTagWithEcho Convert from <?= to <?php echo. DocBlockToComment Replace docklocks with regular comments if it uses a non-structural element. DoubleToSingleQuote Convert T_ECHO double quotation mark from double quotation mark >m. LeftWordWrap Text wrapping with 80 columns - left justify. LongArray Convert short to long arrays. MergeElseJa merge, if still. SplitElseJa merge, if still. MergeNamespaceWithOpenTag – There is no more than one line break before the mildautopreincrement namespace. (Obsolete pass. Use the AutoPreincrement site). NewLineBeforeReturn Add a blank text before adding T_RETURN. OrganizeClass Organize class, interfaces and feature structure. OrderAndRemoveUseClauses Order to use the block and remove unused imports. OnlyOrderUseClauses Order usage block - do not remove unused imports. OrderMethod Organize classes, interfaces and feature structures. OrderMethodAndVisibility Organize classes, interfaces and feature structures. PHPDocTypesToFunctionTypehint Read variable types from PHPDoc blocks and add them to function signatures. PrettyPrintDocBlocks Prettify Doc Blocks PSR2EmptyFunction the body of a blank function in one function header row. PSR2MultilineFunctionParams divide function parameters into multiple lines. ReindentAndAlignObjOps align object operators. ReindentSwitchBlocks Reindent one level of deeper content in the switch blocks. RemoveIncludeParentheses Remove parentheses from include declarations. RemoveSemicolonAfterCurily Remove semicolon after closing curly braces. RemoveUseLeadingSlash Remove leading slash T_USE import. ReplaceBooleanAndOr Convert from and/or to &&/|. Danger! This transition causes behavioral changes. ReplaceIsNull Replace is_null ($a) with null ==== $a. RestoreComments Restore any comment content formatting. ReturnNull Simplify empty return. ShortArray Convert old array to new array. (array() -> []) SmartLnAfterCurlyOpen Add a line break by adding an indirect curly block. SortUseNameSpace Sort usage clauses by length and alphabetic order. SpaceAroundControlControls Add space around the control structures. SpaceAroundExclamationMark Add spaces around the exclamation mark. SpaceBetweenMethods Put a space between methods. StrictBehavior Activate a strict option array_search, base64_decode, in_array, array_keys, mb_detect_encoding. Danger! This transition causes behavioral changes. StrictComparison All comparisons are converted to strict. Danger! This transition causes behavioral changes. StripExtraCommaInArray Remove the end commas in array blocks StripNewlineAfterClassOpen Strip blank rows after opening the class with a curly brace. StripNewlineAfterCuri evilOpen an empty line opening curved brace. StripNewlineWithinClassBody Strip empty lines after opening the class in curly braces. StripSpaces Remove all empty spaces in the Control structures of StripSpaceWithinControlStructures Strip. TightConcat – Make sure that the string concatenation has no spaces, unless they are close to the numbers. TrimSpaceBeforeSemicolon Remove blank lines before semicolons. UpgradeToPreg Upgrade ereg* calls preg * WordWrap Word wrap at 80 columns. Update the old constructor names for the new. YodaComparisons Execute Yoda Comparisons. What does it do? Before <?php for ($i = 0; $i < 10; $i ++) {if($i%2==0) echo Flipflop; } <?php for ($i = 0; $i < 10; $i ++) { if ($i%2 == 0) { echo Flipflop; } <?php $a = 10; $otherVar = 20; $third = 30; <?php $a = 10; $otherVar = 20; $third = 30; It can be enabled with the enable_auto_align <?php namespace NS\Something; Use \OtherNS\C; Use \OtherNS\A. use \OtherNS\D; $a = new A(); $b = new C (); $d = new D(); <?php namespace NS\Something; Use \OtherNS\A. Use \OtherNS\C; use \OtherNS\D; $a = new A(); $b = new C (); $d = new D(); note how it sorts the usage clauses and removes the unused clauses - PSR version Before after <?php on ($i = 0; $i < 10; $i++) {if($i%2==0) echo Flipflop; } <?php par ($i = 0; $i < 10; $i ++) {if ($i%2 == 0) { echo Flipflop; } } } Mark 4 spaces for identification. Spaces. class A (function a(){ return 10; } } <?php class A {public function a() { return 10; } } class Write down the position of the braces and adjust visibility in the method a(). <?php namespace NS\Something; Use \OtherNS\C; Use \OtherNS\A. use \OtherNS\D; $a = new A(); $b = new C (); $d = new D(); <?php namespace NS\Something; Use \OtherNS\A. Use \OtherNS\C; use \OtherNS\D; $a = new A(); $b = new C (); $d = new D(); Note how it sorts usage clauses, and removes unused ones troubleshooting Make sure you can run PHP from the command line. If you need support, please open the question fmt questions most FAQ I want to use sublime-phpfmt, but it needs PHP 5.6 or later and on my production server I have PHP 5.5 or older. What should I do? Consider installing stand-alone PHP 5.6 in a separate directory and have it not configured in the environment. Within the plug-in, php_bin the following parameter is listed on this stand-alone installation. Thank you acknowledgement
